
Sample Management Operations

TSMP Handbook & Standard Operating Procedure

GTM Samples · 大T / EMEA Team

A practical what / why / how guide to running the end-to-end GTM sample lifecycle on TSMP — written so the next person can pick up the role with minimal friction.

Prepared by	Kessog Chan (chukwan)
Source	Handover training with Ziyi Zhang, 16-Jun-2026
Version / Date	v1.0 · 16-Jun-2026
System of record	TSMP — Terminal Sample Management Platform

1. Purpose & How to Use This Handbook

This handbook documents the GTM sample-management operation as handed over on 16-Jun-2026. It exists for two reasons: (1) to be my own reference while I learn the role, and (2) to let the **next owner pick the role up quickly** without re-deriving everything from scratch.

Read it top to bottom once. Afterwards, use Section 3 (Concepts) and Section 5 (Step Detail) as a lookup. The onboarding checklist in Section 7 is the fastest path to becoming operational.

2. What This Role Is — and Why It Matters

What. A sample (樣機) is a physical device we lend out to drive a sale — for customer trial, testing, or early demos. Managing samples means requesting them, shipping them, tracking every unit, getting them signed for, and closing each one out (核銷) before it expires.

Why it matters. Every sample on your name is effectively a **debt on the company's books**. The governing rule is 帳實一致 / CIAG (Consistency of Inventory Accounts and Goods): if the system says a unit is under your name, you must be able to physically produce that exact SN on demand. If you can't, it is an inventory shortfall (盤虧) — treated as asset loss.

The consequences are real, not theoretical:

- **Expiry (超期):** a sample left past its registration period triggers an internal notification — it is a reportable compliance event.
- **Loss:** an untraceable unit ends in 賠償核銷 (compensation write-off) — you pay the company back.
- **Audit:** spot-checks and quarterly stocktakes verify accounts vs goods.

This is why the real job is not data entry — it is disciplined tracking and chasing the flow.

3. Core Concepts & Glossary

Term	What it means
TSMP	Terminal Sample Management Platform — the only legal IT system for requesting, transferring, renewing and writing off samples.
GTM sample	The only sample category our department uses (vs marketing samples).
Seeding (種子)	For KOL/VIP/customer trial. Can be given away. Validity ~6 months. Approval more complex.
Test (測試)	Customer evaluates before buying. Can be given. Validity 1 year. Physical OR non-physical write-off. Simpler approval → default choice .
Expansion (拓展)	Early-stage demo only. Show but never give . Must be physically written off; the unit must always remain with us.
Version stages	V3 (earliest, expansion only) → VN1 (near-final; request for IOT) → VN2 / mass-production (request for wearables & earphones). Newer = more stable.
核銷 (write-off)	Closing a sample's 'debt'. Physical (return to RTC), Non-physical (signed proof it was given/destroyed), or Compensation (pay for a lost unit).
RTC 庫房	Reverse Test Center — where expired/unused units are shipped back; inspectors verify SN & condition, then close the case (physical write-off).

Term	What it means
掛賬週期	Registration/aging period (e.g. 6 or 12 months). Past it, without write-off or renewal, the unit is 'overdue' and you are flagged.
二次分配	Secondary distribution. Does NOT change the registered owner — you remain first-responsible and must keep counting it.
帳實一致 / CIAG	Accounts must match goods. The top audit rule (see Section 2).
掛賬人	Account holder — who the unit is registered to (UK → Ding Cheng / 程哥; Italy → Michele Cappabianca).
BOM / BCG	Bill of Materials / Business Conduct Guidelines.

4. The End-to-End Lifecycle (How)

Every sample moves through the same nine stages. The rest of the handbook details each one.

#	Stage	What happens
1	Forecast	Lin Yingshu (機關 admin) announces upcoming samples; you report a rough forecast in her shared sheet (~2-3 of the last version).
2	Apply	When she says 'ready', apply in TSMP immediately — quota can be taken by other countries.
3	Approval	Account holder → admin's manager → Finance (財經).
4	Ship	Status → 等待發貨; allocation handler → supply chain → warehouse ships; tracker number uploaded.
5	Receive & 入庫	1-2 weeks to UK + customs. Auto-inbounds after a while; note manually if it arrives first.
6	Daily management	Maintain the tracker; log every cabinet in/out by SN; hold the key.
7	Write-off / transfer	Get signatures, submit 核銷; transfer (轉賬) between UK/Italy as needed.
8	Expiry	Monthly: handle anything expiring next month (extend 延期 or write off). Never let it expire.
9	Quarterly stocktake	Upload the count to the system each quarter.

5. Step Detail

5.1 Forecast & Application (TSMP fields)

Field	What to enter
Sample type	Always GTM 樣機.
掛賬人 (account holder)	By destination: UK → 程哥 (Ding Cheng); Italy → Michele Cappabianca.
Purpose (用途)	Test (測試) by default — longest validity, flexible write-off, simpler approval. Exceptions (e.g. tablets) are obvious give-aways.
Reason (需求原因)	'客戶測試'.
准入負責人	Always Michele Cappabianca.
Shipping (發貨方式)	PO 發貨 normally; 委託發貨 only for urgent/complex (someone hand-carries).
Address	UK = 'Huawei Technology Inc' (the short one, W2 postcode). Italy address provided separately.
Receiver	Ziyi, or add yourself as a new contact (so reception routes it to us).
Budget	Ignore — the system's budget calc is unreliable and control is flexible.

5.2 Approval Chain

程哥 (account holder) → Lin Yingshu's manager → Finance (財經) → status '等待發貨' → allocation handler at 機關 (one per product) → supply chain → warehouse ships & uploads tracker. **If urgent, chase the handler at each step** — this is normal and expected.

5.3 Receiving & Inbound (入庫)

Logistics take 1-2 weeks to the UK plus customs. Units arrive at reception / Kaiya and reach our desk. Only the account holder can do system inbound, but it usually auto-inbounds after a while. **If a unit arrives before it auto-inbounds, note it in your tracker** so you don't forget a unit the books don't yet show.

5.4 Daily Tracker Management

This is the heart of the job.

- **Export:** 查詢統計 → 樣機掛賬信息查詢 → input 'GTM 樣機' → 導出掛賬 SN 清單. Re-export every 2 weeks to 1 month.
- **Remarks:** the export has no remarks column. Keep your own remarks and **VLOOKUP on SN** (the unique serial number) into each new export.
- **Physical count:** do a full 盤點 at handover; thereafter log every in/out by SN, manually.
- **Cabinet key:** yours alone; keep hidden at your desk, don't take home (others may need access). Internal rule: anyone taking/returning a unit must announce it in the group (creates a record).
- **Counting:** match the SN printed on the box (watches & IOT have it; tiny earphones may not).

5.5 Write-off (核銷) & Transfer (轉賬)

- **Non-physical (signed):** when a customer keeps a unit, they sign the write-off document (template from Ziyi). Fill model/colour/SN; company name usually HN3 or VF3. Print it (need a print card from Kaiya), 程哥/Selina gets the signature, scan it back, submit the write-off in TSMP.
- **Physical:** return the unit to the RTC 庫房, or destroy on site. On-site destruction needs **two people to witness** (the unit is cut with pliers); upload receipt photos.
- **Transfer (轉賬):** if a UK unit is needed in Italy, transfer it to Michele Cappabianca in the system (verify his account is working first).
- Daily, you mainly use renewal (續借) and transfer (轉賬). Purpose-change (用途變更) is rare.

5.6 Expiry Management

Each month, check what expires **next month** (dates are in TSMP) and handle it a month ahead. Options: apply an extension (延期) or write it off. **Never let it expire** — that triggers an internal notification. This covers both UK (程哥) and Italy. For Italy your scope is only **application & extension** — chase Michele Cappabianca (he is busy and slow to reply, so keep at it).

5.7 Quarterly Stocktake

Once a quarter, upload the count to the system (Ziyi will train this next month). Write the count on the quarterly list → pass to 程哥 → he uploads. Rarely, an inspector visits in person.

5.8 Self-Use Policy

You may use spare/older units for learning and customer-demo practice — but ask 程哥 or Ziyi first, the newest units are reserved for customers, ownership stays with the company, and you must mark it in the tracker and return it.

6. Roles & Contacts

Who	Role	When you need them
Ziyi Zhang (84434577)	GTM Ops; your trainer	Anything during the 1-month handover; self-use approval
Lin Yingshu (林穎署)	Sample administrator (機關), all 大T samples	Forecasts, production announcements, any sample question
Ding Cheng / 程哥 (00611102)	UK account holder; account lead	UK approvals; bears responsibility for receipts
Michele Cappabianca (00473733)	Italy account holder; 准入負責人	Italy application & extension — chase him
Selina (瑟琳娜)	Account Manager, customer-facing	Getting customers to sign write-off docs
Regional allocator	Per-category quota owner	Coordinate/chase for extra units when quota runs out
Kaiya	Print card & reception	Printing docs; inbound logistics on site

7. Incoming-Owner Onboarding Checklist

- Get the cabinet key and agree the storage spot.
- Export the current SN list from TSMP and do a full physical count (盤點).
- Set up your tracker with a persistent remarks column (VLOOKUP on SN).
- Get a print card from Kaiya; save the non-physical write-off template.
- Join the two sample WeChat groups (Lin Yingshu is in them).
- Note the 5 units out without receipts — follow up with Selina / 程哥 for signatures.
- Test a transfer (轉賬) to Michele Cappabianca to confirm his account works.
- Diarise a monthly expiry check (UK + Italy) and chase Michele for Italy.
- Locate / resolve the one lost unit currently marked '?'.
Note: This unit is currently marked '?' in the system.
- Book the quarterly stocktake training with Ziyi.

8. Common Pitfalls & Risk Notes

- **If you don't log it, you forget it.** Receipts arrive late and units move between customers — untracked units become tomorrow's 盤虧.
- **Expiry is silent until it bites.** Check a month ahead; an expired unit is a reportable event.
- **The system is data entry; the job is chasing.** Quota, approvals, payments and logistics all stall on 機關 — budget time to follow up.
- **Inherited unknowns.** One unit is already untraceable ('?'). Reconcile fully at handover so you don't inherit someone else's gap.

9. Improvement Backlog

The tracking is manual and memory-dependent. A lightweight tool could (1) persist remarks across re-exports by SN, (2) auto-flag units expiring next month for both UK & Italy, and (3) generate a

follow-up list of units out without signed receipts. This would directly reduce the compliance and shortfall risk described above — a candidate to pilot in spare capacity.
